Registry File, for complete details:
<http://www.cas.org/ONLINE/STN/STNOTES/stnotes27.pdf>

The P indicator for Preparations was not generated for all of the
CAS Registry Numbers that were added to the H/Z/CA/CAPLUS files between
12/27/01 and 1/23/02. Use of the P indicator in online and SDI searches
during this period, either directly appended to a CAS Registry Number
or by qualifying an L-number with /P, may have yielded incomplete results.
As of 1/23/02, the situation has been resolved. Also, note that searches
conducted using the PREP role indicator were not affected.

Customers running searches and/or SDIs in the H/Z/CA/CAPLUS files
incorporating CAS Registry Numbers with the P indicator between 12/27/01
and 1/23/02, are encouraged to re-run these strategies. Contact the
CAS Help Desk at 1-800-848-6533 in North America or 1-614-447-3698,
worldwide, or send an e-mail to help@cas.org for further assistance or to
receive a credit for any duplicate searches.

L29 ANSWER 1 OF 17 HCAPLUS COPYRIGHT 2002 ACS
2001:400113 Document No. 136:118804 New routes to monomers and polymers for LEDs. Holmes, Andrew B.; Martin, Rainer E.; Geneste, Florence; Fischmeister, Cedric; Cacialli, Franco; Riehn, Robert E.; Friend, Richard H. (Melville Laboratory for Polymer Synthesis, Department of Chemistry, University of Cambridge, Cambridge, CB2 3RA, UK). Proceedings of SPIE-The International Society for Optical Engineering, 4105(Organic Light-Emitting Materials and Devices IV), 53-58 (English) 2001. CODEN: PSISDG. ISSN: 0277-786X. Publisher: SPIE-The International Society for Optical Engineering.

AB A new route to the synthesis of poly(1,4-phenylenevinylene)s (PPVs) contg. a 2,3-dialkoxy substitution pattern was developed. Poly[2,3-bis(2-ethylhexyloxy)-1,4-phenylenevinylene] (BEH-PPV) was prepd. by Gilch polycondensation, and its optical properties were compared with those of poly(2,3-dibutoxy-1,4-phenylenevinylene) (DB-PPV). The precursors for the Gilch method have traditionally been prepd. by methods which have certain disadvantages. These can be overcome by the use of directed metalation reactions which are illustrated in the synthesis of some poly(2,5-disilyl-substituted 1,4-arylenevinylene) derivs.

2001:376204 Document No. 135:172766 Polymer and small molecule multi-layer light-emitting diodes. Sano, T.; Tuan, C. S.; Martin, R. E.; Chuah, B. S.; Holmes, A. B. (Melville Laboratory for Polymer Synthesis, Department of Chemistry, University of Cambridge, Cambridge, CB2 1EW, UK). Synthetic Metals, 121(1-3), 1701-1702 (English) 2001. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB Small mol. electron-transport materials were used to improve luminous efficiency in polymer light-emitting diodes (PLEDs). 1,3-Bis[5-(p-t-butylphenyl)-1,3,4-oxadiazol-2-yl]benzene (OXD-7) and tris(8-hydroxyquinolinato)aluminum (Alq3) were employed as an electron-transport layer, which was deposited onto a spin-coated film of poly(2,3-dibutoxy-1,4-phenylene vinylene) (DB-PPV) in an electroluminescent device. Luminous efficiency was remarkably improved by incorporating an electron-transport layer, which can be explained with the energy-band scheme of the org. materials.

2001:355848 Document No. 135:123029 Muon-spin relaxation study of charge carrier dynamics in the conducting polymer PPV. Blundell, S. J.; Pratt, F. L.; Marshall, I. M.; Husmann, A.; Hayes, W.; Martin, R. E.; Holmes, A. B. (Claredon Laboratory, Parks Road, Oxford University Department of Physics, Oxford, OX1 3PU, UK). Synth. Met., 119(1-3), 205-206 (English) 2001. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB Muon-spin relaxation (.mu.SR) expts. on the conducting polymer poly(2,3-dibutoxy-1,4-phenylenevinylene) (DB-PPV) probe the dynamics of the highly mobile polarons created by the muon-implantation process in which muonium reacts with the polymer forming a radical state. The fluctuating spin d. induced by the electronic spin defect rapidly diffusing up and down the chain leads to a characteristic relaxation, the temp. and field dependence of which permit extn. of on-chain and interchain diffusion rates. These results provide information concerning the charge-transport mechanism in DB-PPV.

2001:355771 Document No. 135:107952 Efficient electroluminescent poly(p-phenylene vinylene) copolymers for application in LEDs. Martin, Rainer E.; Geneste, Florence; Riehn, Robert; Chuah, Beng Sim; Cacialli, Franco; Holmes, Andrew B.; Friend, Richard H. (Melville Laboratory for Polymer Synthesis, Department of Chemistry, Pembroke Street, University of Cambridge, Cambridge, CBL2 3RA, UK). Synthetic Metals, 119(1-3), 43-44 (English) 2001. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB A new and efficient route for the synthesis of poly(p-phenylene-vinylenes) (PPVs) contg. dialkoxy substituents at the 2,3-positions of the phenylene ring of the polymer backbone has been developed. In comparison to the more classical 2,5-substitution pattern these PPV polymers show a significantly blue-shifted longest wavelength absorption (λ_{max}) and emission band (λ_{em}). Two statistical PPV copolymers comprising 2,3-dibutoxy and dimethyloctylsilyl- or 2,5-bis(dimethyloctylsilyl) side-chains were synthesized via the Gilch dehydrohalogenation route. Double layer ITO/PEDOT/polymer/Ca were demonstrated to combine high electroluminescence efficiencies with low turn-on voltages.

CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB In recent years, variously substituted derivs. of poly(1,4-phenylene
vinylene)s have emerged as efficient candidates for the emissive
layer in polymer light emitting diodes. The synthetic routes for
these polymers divide between precursor routes and those leading to
fully conjugated solvent-processible polymers. The Gilch
dehydrohalogenation polycondensation has largely been used for the
latter class. In this presentation, we describe a novel family of
2,3-disubstituted arom. precursors, derived from catechol, and we
report their efficient polymn. as homo- and copolymers with, for
example, silyl-substituted derivs. to give materials which are
highly fluorescent and serve as interesting materials in polymer
LEDs.

L29 ANSWER 6 OF 17 HCAPLUS COPYRIGHT 2002 ACS
 2000:819744 Document No. 134:57060 Versatile syntheses of various homo- and copolymers of poly(1,4-arylene vinylene)s. Martin, R. E.; Chuah, B. S.; Riehn, R. H.; Geneste, F.; Cacialli, F.; Friend, R. H.; Holmes, A. B.; Morgado, J. (Melville Laboratory for Polymer Synthesis, Department of Chemistry, University of Cambridge, Cambridge, CB2 3RA, UK). Mater. Res. Soc. Symp. Proc., 598(Electrical, Optical, and Magnetic Properties of Organic Solid-State Materials V), BB2.1/1-BB2.1/11 (English) 2000. CODEN: MRSPDH. ISSN: 0272-9172. Publisher: Materials Research Society.
 AB The synthesis of poly(1,4-phenylene vinylene)s (PPVs) contg. a 2,3-dialkoxy substitution pattern has been developed. Poly[2,3-bis(2-ethylhexyloxy)-1,4-phenylene vinylene] (BEH-PPV, 4) was prepd. and its optical properties compared with the recently discussed poly(2,3-dibutoxy-1,4-phenylene vinylene) (DB-PPV, 1), which showed in contrast to classical 2,5-substituted PPV derivs. a notable blue-shift of the longest-wavelength absorption

(.lambda.max) and a considerable increase of the solid-state photoluminescence (PL) efficiency. The two statistical PPV copolymers 5 and 6 comprising 2,3-dibutoxy and dimethyloctylsilyl- or 2,5-bis(dimethyloctylsilyl) side-chains, resp., were synthesized via the Gilch dehydrohalogenation route. Double-layer light-emitting devices (LEDs) were demonstrated to combine high electroluminescence efficiencies with low turn-on voltages.

Chem., Univ. of Cambridge, Cambridge, UK). Proc. SPIE-Int. Soc. Opt. Eng., 3797(Organic Light-Emitting Materials and Devices III), 48-57 (English) 1999. CODEN: PSISDG. ISSN: 0277-786X. Publisher: SPIE-The International Society for Optical Engineering.

AB In this paper we report the synthesis of useful monomers and their application in the Gilch dehydrohalogenation and Wittig polycondensation methods to prep. highly luminescent poly(1,4-phenylene vinylene) (PPV) homopolymers and copolymers for use in light emitting devices. Alkoxy, including crown ethers, and silylated monomers were used in the polymn. of the PPV's. The electroluminescence emission color was obsd. to be device-dependent, ranging from yellow to green. Several electroluminescence properties of the polymers were detd. including HOMO and LUMO, photoluminescent efficiency, and onset potentials.

Publisher: Wiley-VCH Verlag GmbH.

AB The synthesis of the highly fluorescent mono- and bisilylated
poly(1,4-phenylenevinylene) derivs. is discussed. The Gilch
dehydrohalogenation polycondensation and the Horner synthesis of
strictly alternating copolymers have been used to prep. the various
copolymers, in which the tunability of various optoelectronic
properties may be examd. systematically.

2000:377763 Document No. 133:141986 Luminescence properties of PPV-based copolymers with crown ether substituents. Morgado, J.; Cacialli, F.; Friend, R. H.; Chuah, B. S.; Moratti, S. C.; Holmes, A. B. (Cavendish Laboratory, Cambridge, CB3 0HE, UK). Synth. Met., 111-112, 449-452 (English) 2000. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB The authors present the optical properties of four poly(p-phenylenevinylene) (PPV)-based statistical copolymers, which combine monomers of highly luminescent polymers and monomers carrying crown ether side groups. The photoluminescence efficiency for films on Spectrosil ranges from 28% to 52%, whereas the electroluminescence (EL) efficiency of single-layer diodes with Al cathodes reaches 0.6 cd/A (internal quantum efficiency of 1.4%). Surprisingly, the efficiency for Ca cathodes diodes is lower than for Al ones. Slight variation of the EL spectra from pixel to pixel affects all the copolymers of the family, and the authors consider that it is indicative of chain aggregation induced by the crown ether moieties. Studies of light-emitting electrochem. cells, LECs, based on one of these polymers show that the ion mobility induced by the presence of the crown ethers is relatively small. Typical LEC behavior was obsd. upon addn. of poly(ethylene oxide), with EL internal quantum efficiency reaching 2.3%.

2000:104489 Document No. 132:294105 Efficient blue-green light
 emitting poly(1,4-phenylene vinylene) copolymers. Martin, Rainer

E.; Geneste, Florence; Chuah, Beng Sim; Holmes, Andrew B.; Riehn, Robert; Cacialli, Franco; Friend, Richard H. (Melville Lab., Dep. Chem., University of Cambridge, Cambridge, CB2 3RA, UK). Chem. Commun. (Cambridge) (4), 291-292 (English) 2000. CODEN: CHCOFS. ISSN: 1359-7345. Publisher: Royal Society of Chemistry.

AB 2,3-Dialkoxy-substituted poly(1,4-phenylene vinylene) (PPV) homo- and co-polymers were prep'd. by the Gilch dehydrohalogenation polycondensation of the corresponding bis(alkylomethyl-substituted benzene monomers). The polymers prep'd. are poly[(2-dimethyloctylsilyl-1,4-phenylene vinylene)-co-(2,3-dibutoxy-1,4-phenylene vinylene)] (DMOS-co-DB-PPV) and poly[bis[(2,5-dimethyloctylsilyl)-1,4-phenylene vinylene]-co-(2,3-dibutoxy-1,4-phenylene vinylene)] (BDMOS-co-DB-PPV). Optical absorption measurements of the DMOS-co-DB-PPV and BDMOS-co-DB-PPV conducting polymers indicate λ_{max} of 440 and 442 nm, resp., and solid-state photoluminescence efficiency of 35 and 28%, resp. Double layer light emitting test devices fabricated with these materials exhibited high electroluminescence efficiency with low turn-on voltage.

polymers. Cacialli, Franco (Cavendish Laboratory, Cambridge University, Cambridge, CB3 0HE, UK). Curr. Opin. Colloid Interface Sci., 4(2), 159-164 (English) 1999. CODEN: COCSFL. ISSN: 1359-0294. Publisher: Elsevier Science Ltd..

AB A review with 46 refs. Several advances were reported in the field of conjugated polymer semiconductors over the last year. Major breakthrough relate to the achievement of high electroluminescence efficiency via exploitation of phosphorescence, of high efficiency photovoltaic cells, and of a better understanding of the properties of charged and neutral excitations in this class of unconventional semiconductors.

1999:456000 Document No. 131:200167 A highly luminescent polymer for LEDs. Chuah, B. S.; Cacialli, F.; Dos Santos, D. A.; Feeder, N.; Davies, J. E.; Moratti, S. C.; Holmes, A. B.; Friend, R. H.; Bredas, J. L. (Melville Laboratory for Polymer Synthesis & Department of Chemistry, University of Cambridge, Cambridge, CB2 3RA, UK). Synth. Met., 102(1-3), 935-936 (English) 1999. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB A new poly(2,3-dibutoxy-1,4-phenylenevinylene) is reported with high photoluminescence (.apprx.40%) and electroluminescence efficiencies. The unusual substitution pattern is effective in tuning the emission color as the polymer exhibits unexpected blue-shifted emission to the green region. Crystal structures of model oligomers (PL efficiencies .apprx.80%) and theor. calcns. on optimized geometry offer insight into these interesting properties.

1999:455995 Document No. 131:162791 A green emitting, alkoxy disubstituted poly(p-phenylene vinylene) for electroluminescent devices. Cacialli, F.; Chuah, B. S.; Kim, J. S.; Dos Santos, D. A.; Friend, R. H.; Moratti, S. C.; Holmes, A. B.; Bredas, J. L. (Cavendish Laboratory, Cambridge University, Cambridge, CB3 0HE, UK). Synth. Met., 102(1-3), 924-925 (English) 1999. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB The authors report the effects of the substitution of butoxy chains on the Ph 2,3 positions of poly(p-phenylene vinylene) (PPV). This substitution has a remarkable influence on the optical and electroluminescent properties of the resulting semiconductor (DB-PPV) which does not show the red shift of the emission, typical of alkoxy substituted PPVs, such as poly(2-methoxy-5-(2'-ethyl-hexyloxy)-1,4-phenylene vinylene), MEH-PPV, dominated by the influence of the .pi.-electron rich O atom. The authors report photoluminescence (PL), quantum efficiencies of .apprx.40%, electroluminescence (EL) efficiencies of .apprx.0.6 cd/A in 2-layer ITO/PPV/DB-PPV/Ca diodes, and luminances up to 4500 cd/m2.

AB Conjugated poly(1,4-arylene vinylene) derivs. comprising an arylene unit having adjacent substituents are described in which the substituents are oriented so as to affect the electronic structure of the compd. sufficiently to cause a blue-shift in the photoluminescence and/or electroluminescence of the compd. Methods for the prodn. of the compds. are described which entail polymg. a bis(halomethyl) substituted aryl monomer in the presence of a base (e.g., potassium tert-butoxide) to form a poly(arylene vinylene), wherein the aryl monomer has adjacent substituents on the aryl residue. Use of the polymers in devices, esp. (opto)electronic devices, is also described. Methods for producing the devices entail applying a soln. of the compd(s). (e.g., in chloroform) to a substrate to form a film.

AB Org. semiconductors that consist of conjugated oligomers or polymers are the subject of considerable current research interest due to their fundamental opto-electronic physics and their potential applications in photo-diodes, light-emitting diodes and thin film transistors. The synthesis and device properties of the green light emitting polymer 5 and a model oligomer 8 are described. The org. semiconductor 11 was prepd. and used in a thin film transistor. It exhibits a field effect mobility in the range 0.02-0.05 cm²/V s and a high On/Off ratio.

1998:336234 Document No. 129:46941 New luminescent PPV derivatives for LED applications. Chuah, B. S.; Cacialli, F.; Davies, J. E.; Feeder, N.; Friend, R. H.; Holmes, A. B.; Marseglia, E. A.; Moratti, S. C.; Bredas, J.-L.; Dos Santos, D. A. (Melville Laboratory for Polymer Synthesis, Department of Chemistry, University of Cambridge, Cambridge, CB2 3RA, UK). Mater. Res. Soc. Symp. Proc., 488(Electrical, Optical, and Magnetic Properties of Organic Solid-State Materials IV), 87-92 (English) 1998. CODEN: MRSPDH. ISSN: 0272-9172. Publisher: Materials Research Society.

AB A new poly(phenylenevinylene) [PPV] deriv. with dialkoxy substituents at the 2,3-positions of the phenylene ring of the polymer backbone was prepd. Poly(2,3-dibutoxy-1,4-phenylenevinylene) (PDP-PPV) exhibited significantly different properties compared with the typical 2,5-dialkoxy substituted PPV derivs. The polymer is not only significantly blue-shifted in its optical and luminescence properties but also has high photoluminescence (PL) and electroluminescence (EL) efficiencies. Study of the model oligomer offers insight into this interesting behavior. A PPV/PDP-PPV bilayer electroluminescent device with 1.5% efficiency was prepd. by spin coating a sulfonium precursor polymer onto ITO, thermally converting the film to PPV, spin coating PDP-PPV in chloroform onto this hole transport layer, then evapg. calcium or aluminum electrodes. A second bilayer device using poly(vinylcarbazole) as the hole-transport layer produced max. efficiencies of 0.6%.

2001:785486 Document No. 136:86344 Directing Energy Transfer within Conjugated Polymer Thin Films. Kim, Jinsang; McQuade, D. Tyler; Rose, Aimee; Zhu, Zhengguo; Swager, Timothy M. (Department of Chemistry and Department of Materials Science and Engineering and the Center for Materials Science and Engineering, Massachusetts Institute of Technology, Cambridge, MA, 02139, USA). Journal of the American Chemical Society, 123(46), 11488-11489 (English) 2001. CODEN: JACSAT. ISSN: 0002-7863. Publisher: American Chemical Society.

AB A striated multipolymer system comprising conjugated polymer thin films utilizes directional energy transfer to overcome the z-direction (film thickness) limitation in energy transfer. The system comprises three poly(p-phenylene ethynylene)s which have large spectral overlap between donor emission and acceptor absorption ranging from the blue to the red. Multilayers were fabricated by the Langmuir-Blodgett (LB) method starting with the shortest-wavelength polymer (1) spin-cast on a glass substrate, then 16 LB layers of the intermediate wavelength polymer (2), and finally a monolayer of the longest wavelength polymer (3), providing a film where the band gap decreases directionally from the substrate to the polymer-air interface. Emission spectra indicate that most of the energy is transferred from 1 through 16 layers of 2 to 3, demonstrating that energy can be efficiently moved in the z-direction, thereby concg. the energy at the film-air interface, which has significant implications for a turn-on sensor design.

2001:52955 Document No. 134:282868 Optimization of TNT sensory polymers. Rose, Aimee; Lugmair, Claus G.; Miao, Yi-Jun; Kim, Jinsang; Levitsky, Igor A.; Williams, Vance E.; Swager, Timothy M. (Department of Chemistry, Massachusetts Institute of Technology, Cambridge, MA, 02139, USA). Proc. SPIE-Int. Soc. Opt. Eng., 4038(Pt. 1, Detection and Remediation Technologies for Mines and Minelike Targets V), 512-518 (English) 2000. CODEN: PSISDG. ISSN: 0277-786X. Publisher: SPIE-The International Society for Optical Engineering.

AB The design and synthesis of ultra-sensitive fluorescence sensing materials were reported for the detection of 2,4,6-trinitrotoluene (TNT) and 2,4-dinitrotoluene (DNT), which make use of novel energy migration mechanisms to amplify the fluorescence response. These have led to systems capable of rapid detection of TNT and DNT at the sub part-per-billion levels. Thus, the nature of energy migration in these polymer systems were examd. because this was inherent in achieving amplification and specificity. Polarization measurements and energy transfer studies between polymers were conducted in order to evaluate and maximize energy migration and hence TNT sensory response. The correlation of photophys. properties with mol. structure guided the synthesis of novel polymers with more discriminant optical responses. These synthetic efforts have yielded a library of sensing polymers with varying sensitivities to

different analytes.

S.; Moratti, S. C.; Holmes, A. B. (Av. Rovisco Pais, Dep. Eng. Quimica, Instituto Superior Tecnico, Lisbon, P-1049-001, Port.). J. Appl. Phys., 86(11), 6392-6395 (English) 1999. CODEN: JAPIAU. ISSN: 0021-8979. Publisher: American Institute of Physics.

AB The phase-sepn. and the optoelectronic properties were measured of an alternating poly(p-phenylene vinylene)-based copolymer, to which poly(ethylene oxide), PEO, and or lithium triflate are added. The copolymer is (DB-BTEM-PPV), i.e., 2,3-dibutoxy-1,4-phenylene vinylene and 2,5-bis(triethoxymethoxy)-1,4-phenylene vinylene, with side groups that allow ion solvation and transport. Upon addn. of ion-transporting PEO to DB-BTEM-PPV mixts. with lithium triflate, a sizeable increase in ion cond. and photoluminescence efficiency (from 0.9 to 1.5 cd/A) were obsd., with a concomitant increase of the response time. This effect is attributed to solvation and complexation of lithium triflate by PEO, which simultaneously reduces quenching of photoluminescence (and electroluminescence) efficiency by the ionic charge, and the effectiveness of formation

of highly doped, low-barrier, polymer/electrode interfaces. Charge transport and injection in the copolymer and in the blend are correlated to the characteristics of a test diode and to phase sepn. of PEO as obsd. by at. force microscopy.

AB Poly(phenyleneethynylene)s with electron-rich tetra-alkoxy groups and rigid triptycene moieties were prepd. These polymers are fluorescent in both soln. and solid state. Quenching studies indicate that tetra-alkoxyphenyl contg. polymers show specificity for trinitrotoluene (TNT) over 2,4-dinitrotoluene (DNT), and the effect is attributed to the predominant electrostatic interactions caused by more electron-rich nature of the conjugated polymer chains. Similar polymers with amphiphilic ethylene oxide side chains were also prepd., which display surfactant behavior at the air-water interface. LB monolayers of these polymers exhibit excellent sensitivity and selectivity toward TNT due to their well-defined thin uniform structure.
